IN THE SPECIFICATION

Please amend paragraph **[0028]** as follows:

[0028] Prior to use, at least one database must be generated to contain action/response information relating the pen tip position, current book contents, current page of the book, multimedia contents for the current book, and pre-defined actions for the current book. An application program executing on a publisher's computer system 150, FIG. 1, called a "maker" component herein may be used to create the linkages between these data items. The maker may be used by a publisher (or in some cases by a sophisticated user) to make an interactive multimedia product based on an existing traditional paper book (or possibly a newly published book), with limited manual work. The input data to the maker includes the page images of the book, additional multimedia content, and pre-defined actions. The publisher selects an object on a page image, and links the relevant multimedia content and/or action with the selected object. All linkage information may be stored in the at least one database.
